ABSTRACT

The present invention discloses a method and apparatus for implementing signaling proxy. The method includes: in a signaling proxy of a communication network, configuring identification information of a message which needs to be processed by the signaling proxy; after receiving the message, the SP determines whether the message needs to be processed by the SP, and if yes, the SP performs proxy processing on and forwards the message. The apparatus includes: a unit for receiving and recognizing messages, a unit for processing messages, and a unit for forwarding messages. According to the present invention, a multiple of terminals can send messages to the same one IP address or domain name, which provides great convenience for wide application of VoIP service. Moreover, specific implementations of the present invention are easy and need no modifications on the present terminal devices.
